

Gulf of Mexico Harmful Algal Bloom Bulletin

Region: Texas

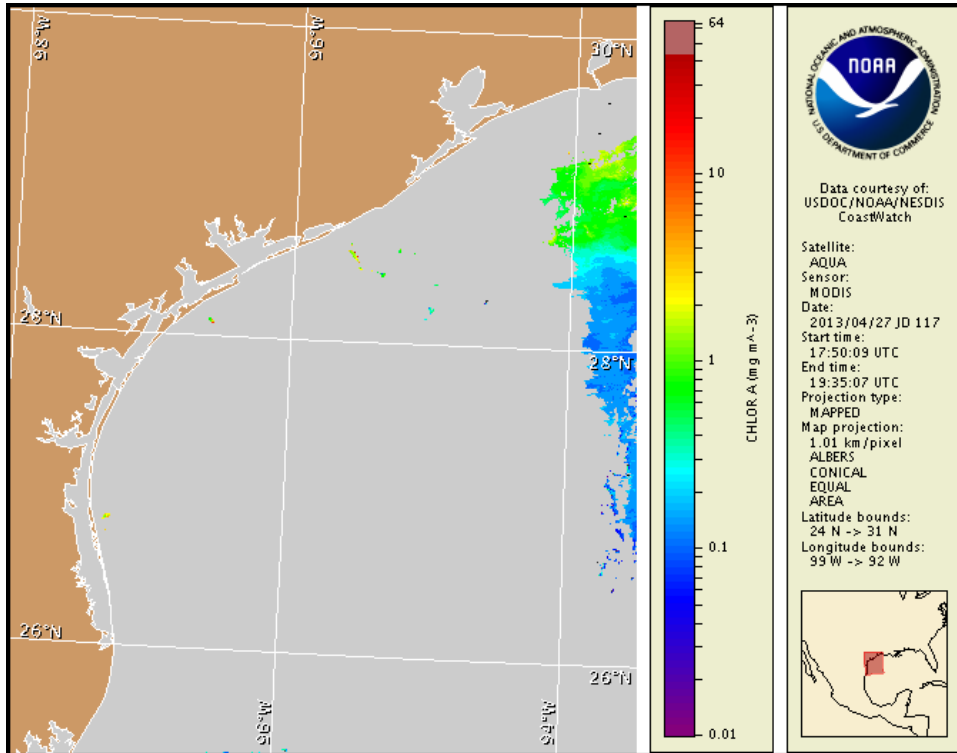

Monday, 29 April 2013

NOAA National Ocean Service

NOAA Satellite and Information Service

NOAA National Weather Service

Last bulletin: Monday, April 22, 2013

Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s), when applicable. Points represent cell concentration sampling data from April 19 to 25: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Detailed sample information can be obtained through the Texas Parks and Wildlife Department at:

<http://www.tpwd.state.tx.us/landwater/water/envconcerns/hab/redtide/status.phtml>

Conditions Report

There is currently no indication of a harmful algal bloom of *Karenia brevis* (commonly known as Texas red tide) at the coast in Texas. No respiratory impacts are expected alongshore the Texas coast today through Monday, May 6. For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Analysis

There is currently no indication of a harmful algal bloom of *Karenia brevis* at the coast in Texas. Recent MODIS Aqua imagery over the past few days (4/27, shown left) has been obscured by clouds, limiting analysis. There was no elevated chlorophyll ($<2 \mu\text{g/L}$) in visible patches offshore the Sabine Pass region.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of 95 km south from the Port Aransas region from April 27 to May 2.

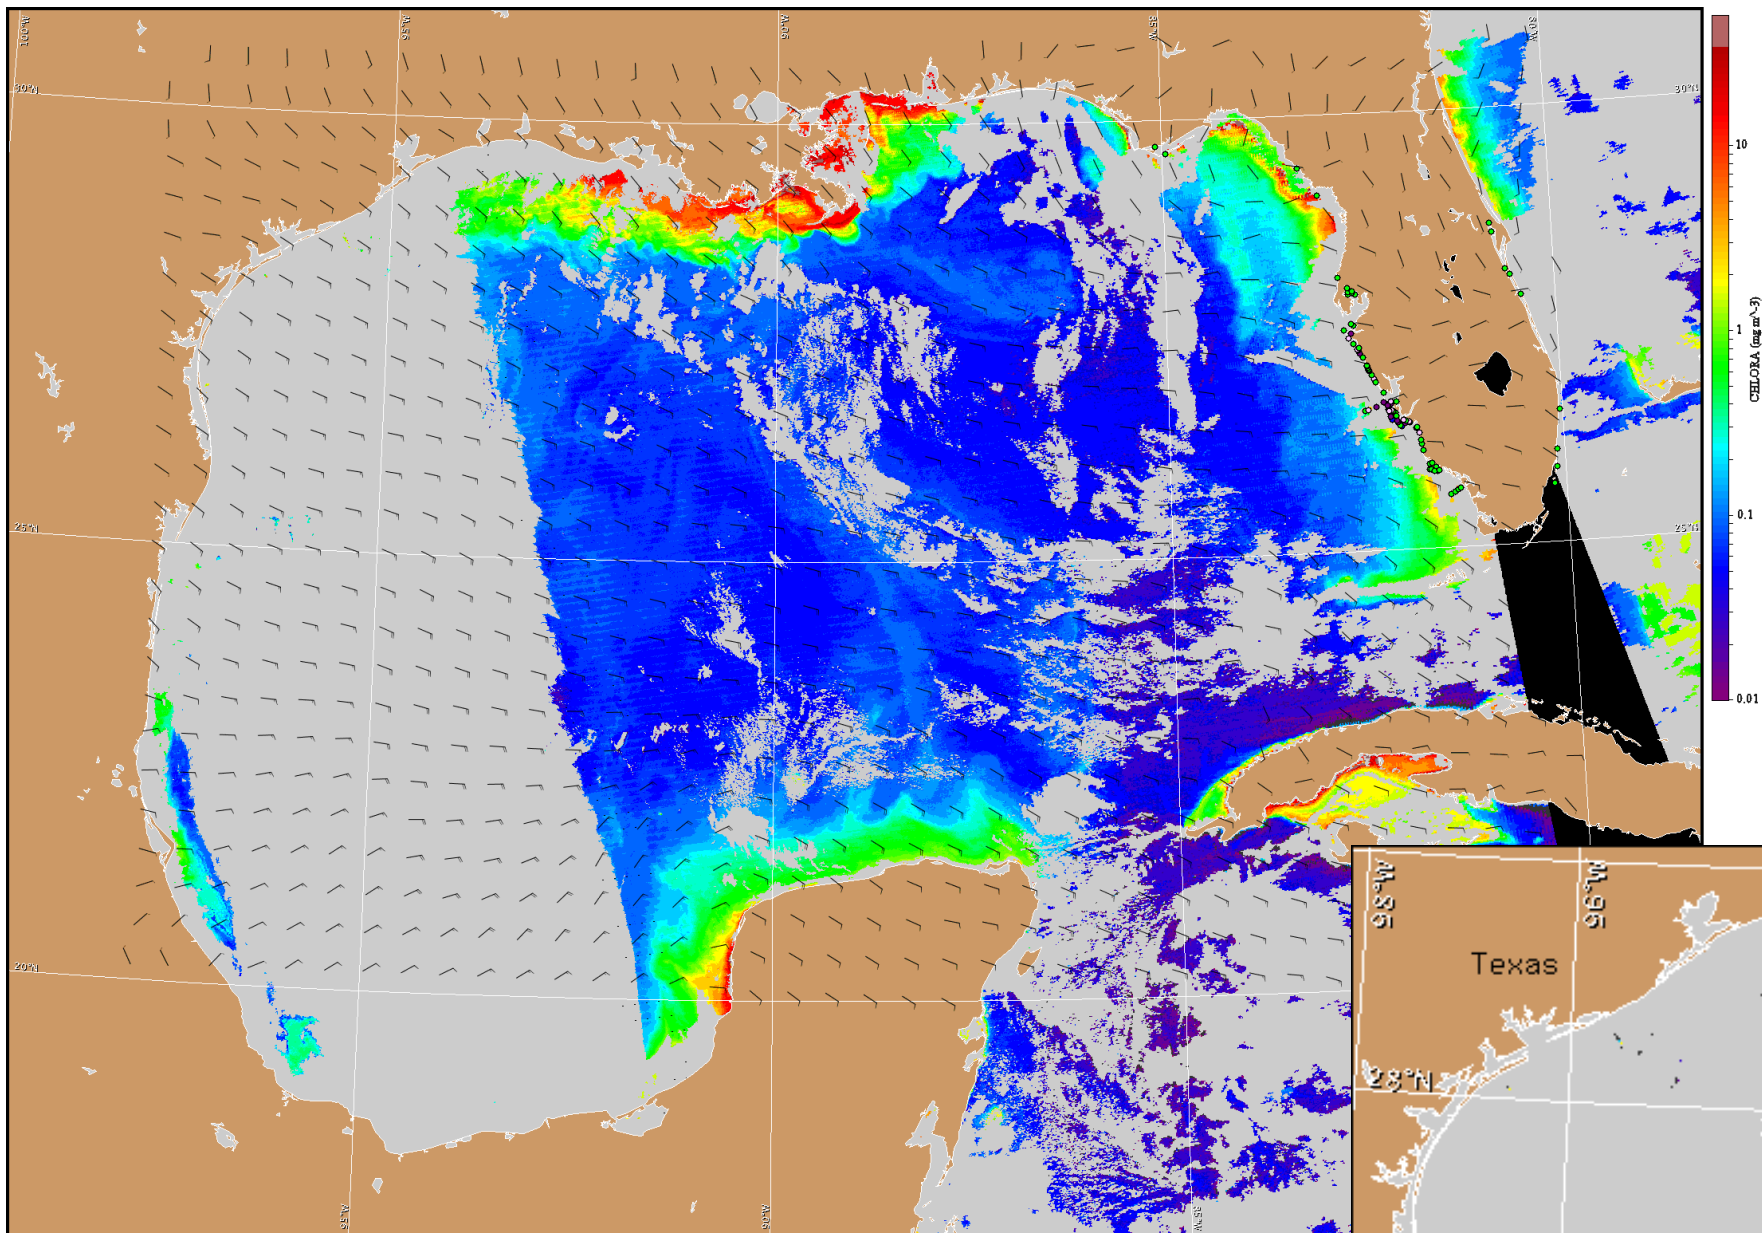

Kavanaugh, Derner

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA's National Weather Service (NWS).

Wind Analysis

Port Aransas: East to southeast winds (5-15 kn, 3-8 m/s) today through Wednesday. Northeast winds (10-15 kn, 5-8 m/s) Thursday becoming north winds (15-30 kn, 8-15 m/s) Thursday afternoon through Friday. North winds (10-15 kn) Friday night becoming northeast winds (5-10 kn, 3-5 m/s) after midnight.

Satellite chlorophyll image and forecast winds for April 30, 2013 06Z with points representing cell concentration sampling data from April 19 to 25: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
